

## LASER TREATMENT FACIAL CAPILLARIES & VASCULAR BLEMISHES

Our clinic offers Laser treatment of facial capillaries, a condition that many people find particularly unsightly. We use Nd Yag long pulsed laser light to diminish or completely destroy such vessels.

A feature of our method, developed in Italy and Germany, is the minimal discomfort that patients experience. We utilise refrigerated air technology to cool the skin while performing the laser treatment.

All new patients require a medical assessment at which time treatment goals are discussed and clinical photos are taken.

A number of treatment sessions may be necessary to achieve a satisfactory result, although at times only one treatment may be necessary. As the body must slowly absorb the laser treated vessels, full results may not be evident for at least 2 months.

Side effects can include crusting, blistering, de-pigmentation, hyper-pigmentation and rarely scar formation. Pain is generally minimal and requires no anaesthetic.

We will advise you of any Medicare rebate that is applicable to these procedures although this is generally only a small proportion of the fee.

Post laser treatment is generally very simple. Application of sun protection topical is important. Bathing with a gentle cleanser or soap is advisable. Do not bathe the face in hot water for several days. We do not recommend exfoliation treatment for 3-4 weeks.
